New peptides capable of modulating a fibrin fragment E activity, useful for inhibiting uncontrolled cell proliferation, e.g. for treating cancer, vascular restenosis, atherogenesis or psoriasis, and for wound healing.

Claim 1; Page 49; 59pp; English.

The present invention relates to a peptide or its fragment, which is capable of modulating a fibrin fragment E activity. The peptides and modulators are useful for inhibiting stimulation of cell proliferation induced by a fibrin degradation product. The antibody or binding fragment is also useful for identifying the active site of the fibrin fragment E receptor. The peptides are particularly useful in treating cancer, vascular restenosis, rheumatoid arthritis, diabetes, renal diseases or psoriasis. The antibodies are also useful for modulating the activity of the peptide

The peptides and modulators are useful for inhibiting stimulation of cell proliferation induced by a fibrin degradation product. The antibody or binding fragment is also useful for identifying the active site of the fibrin fragment ecceptor. The peptides are particularly useful in treating cancer, vascular restenosis, rheumatoid arthritis, diabetes, renal diseases or psoriasis. The antibodies are also useful for modulating the activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptides capable of modulating a fibrin fragment E activity, useful for inhibiting uncontrolled cell proliferation, e.g. for treating cancer, vascular restenosis, atherogenesis or psoriasis, and for wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAB59250
```

```
The present invention relates to a peptide or its fragment, which is capable of modulating a fibrin fragment E activity. The peptides and modulators are useful for inhibiting stimulation of cell proliferation induced by a fibrin degradation product. The antibody or binding fragment is also useful for identifying the active site of the fibrin fragment erceptor. The peptides are particularly useful in treating cancer, vascular restenosis, rheumatoid architis, dabetes, renal diseases or psoriasis. The antibodies are also useful for modulating the activity of
                                                                                                                                                                                                                                                                        New peptides capable of modulating a fibrin fragment B activity, useful for inhibiting uncontrolled cell proliferation, e.g. for treating cancer, vascular restenosis, atherogenesis or psoriasis, and for wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Jaye MC;

Cheadle C, South VJ,

comparison of the positive peptides revealed a highly reiterated, proline "rich," a mino acid consensus motif (i.e. the sequence RPLPXXP). This motif demonstrated a strong similarity to a Src SH3 binding sequence identified within a protein isolated by screening a lambda-lox mouse mebryo cDNA library with a Src SH3 domain probe. The present sequence is that of one of the positive peptides dientified from the fuse SB random display library. (Updated on SS-WAR-2003 to correct or field.) A fusion phage library for expressing random 15mer peptides was prepared using the filamentous bacteriophage fuse 5B. The display library was screened for peptides which bind to the Src SH3 domain. A sequence New DNA encoding proteins that bind to Src-homology domain 3 - used to inhibit signal transduction, e.g. in cases of T cell activation. Example 1; Col 7; 39pp; English.

Treating a cancer patient involves administering to patient a cytotoxic T -lymphocyte, an antigen presenting cell that activates T cells, a peptide of cytochrome P450 1B1, or a polynucleotide encoding the peptide.

```
The present any order of the present any expectation of the present any expension or is at risk of having, a cell enteresting cytochrome P450 IBI (CYPIBI), which involves administering to the patient a cytochroxic T-lymphocyte of CTL, a peptide of CYPIBI that binds to major histocompatibility activates CTL, a peptide of CYPIBI that binds to major histocompatibility complex (MHC) molecule, or a nucleic acid molecule encoding CYPIBI or complex (MHC) molecule, or a nucleic acid molecule encoding CYPIBI or complex (MHC) molecule, involving measuring the level of CTL binds to MHC complex molecule, involving measuring the level of CTL complex molecule, involving measuring the level of CTL complex molecule, involving measuring the level of CTL complex molecule. (I) that binds to MHC complex molecule, (3) an expirate of a CYPIBI peptide (1) that binds to MHC complex molecule, (3) an expirate of a CYPIBI peptide (1) that binds to MHC complex molecule. The method is useful for treating a patient or generated APC (III) that presents a peptide of a CYPIBI in the context of a MHC complex molecule. The method is useful for treating a patient of a surface or is useful for the prevention, treatment and diagnosis of cancer, e.g. complex molecule, and useful for the prevention, treatment and diagnosis of cancer, e.g. complex ovarian, uterine, cervical, prostate, liver, colon, pancreatic and brain cancer. AAM06905 to AAM1356s represent CYPIBI peptides which can bind to human leukocyte antigens (HinAs), as well as other amino acid context of the present invention acid in the exemplification of the present invention
                                                                                             The present invention describes a method for treating a patient having

```
The present invention describes a method for treating a patient having, or is at risk of having, a cell expressing cytochrome P450 1B1 (CYP1B1), white which involves administering to the patient a cytocoxic T-lymphocyte (CTL) that kills the cell, an anticlen presenting cell (APC) that activates CTL, a peptide of CYP1B1 that binds to major histocompatibility complex (MHC) molecule, or a nucleic acid molecule encoding CYP1B1 or peptide of CYP1B1. Also described are: (1) a method for assessing the clevel of immunity of a patient to CYP1B1 or a peptide of CYP1B1 that binds to MHC complex molecule, involving measuring the level of CTL specific for CYP1B1 or the peptide of CYP1B1 in a sample from the patient (2) a CYP1B1 peptide (1) that binds to MHC complex molecule, (3) an exvivo generated APC (III) that specifically kills a cell expressing CYP1B1 in a specific of a MHC complex-restricted fashion; and (4) and exvince context of a MHC complex molecule. The method is useful for treating a patient context of a mHC complex molecule. The method is useful for treating a patient context of a mHC complex molecule. The method is useful for treating a patient context of a mHC complex molecule. The method is useful for treating a patient context of a mHC complex molecule. The method is useful for treating a patient context of a min overian, uterine, cervical, prostate, liver, colon, pancreatic and colon vorsian, uterine, cervical, prostate, liver, colon, pancreatic and colon pain cancer. AAMO6005 to AAM1356 represent CYPIB1 peptides which can bind to human leukocyte antigens (HIAs), as well as other amino acid sequence used in the exemplification of the present invention

Treating a cancer patient involves administering to patient a cytotoxic T -lymphocyte, an antigen presenting cell that activates T cells, a peptide of cytochrome P450 1B1, or a polynucleotide encoding the peptide.

Disclosure; Page 68; 121pp; English

The present invention describes a method for treating a patient having, or is at risk of having, a cell expressing cytochrome P450 1B1 (CYPIB1), which will have be patient a cytocoxic T-lymphocyte (CTL) that kills the cell, an antigen presenting cell (APC) that activates CTL, a peptide of CYPIB1 that binds to major histocompatibility complex (MHC) molecule, or a nucleic acid molecule encoding CYPIB1 or peptide of CYPIB1 or method for assessing the complex (MHC) molecule, involving measuring the level of fimmunity of a patient to CYPIB1 or a peptide of CYPIB1 that binds to MHC complex molecule, involving measuring the level of CTL specific for CYPIB1 or the peptide of CYPIB1 in a sample from the patient compensated CTL (II) that binds to MHC complex molecule; (3) an exvivo generated APC (III) that specifically kills a cell expressing CYPIB1 in a specific of a MHC complex restricted feshion; and (4) an ex vivo generated APC (III) that presents a peptide of a CYPIB1 in the context of a MHC complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule, or avoing a cell that expresses CYPIB1. The method is useful for the prevention, treatment and diagnosis of cancer, e.g. melanoma, lymphoma, carcinoma, sarcoma, multiple myeloma, leukemia, and compance in the exemplification of the present invention

Treating a cancer patient involves administering to patient a cytotoxic T-lymphocyte, an antigen presenting cell that activates T cells, a peptide of cytochrome P450 1B1, or a polynucleotide encoding the peptide.

```
or is at risk of having, a cell expressing cytochrome P450 IBI (CYPIB1), which involves administering to the patient a cytochrome P450 IBI (CYPIB1), which involves administering to the patient a cytochrome P450 IBI (CYPIB1), that kills the cell, an antigen presenting cell (APC) that activates CTL, a peptide of CYPIBI that binds to major histocompatibility complex (MHC) molecule, or a nucleic acid molecule encoding CYPIBI or peptide of CYPIBI. Also described are: (1) a method for assessing the level of immunity of a patient to CYPIBI or a peptide of CYPIBI that binds to MHC complex molecule, involving measuring the level of CTL binds to MHC complex molecule, involving measuring the level of CTL crowled in the peptide of CYPIBI in a sample from the patient or (2) a CYPIBI peptide (I) that binds to MHC complex molecule; (3) an exvivo generated CTL (II) that specifically kills a cell expressing CYPIBI or a peptide of a CYPIBI in the context of a MHC complex molecule. The method is useful for treating a patient or service of having a cell that expresses CYPIBI. The method is useful for the prevention, treatment and diagnosis of cancer e.g. melanoma, lamphoma, carcinoma, sactoma, multiple myeloma, leukemia, and brain cancer. AAM06905 to AAM1356s represent CYPIBI peptides which can bind to human leukocyte antigens (HLMAS), as well as other amino acid context of sequence used in the exemplification of the present invention
                                                                        The present invention describes a method for treating a patient having

AAWI1098-WI1124 are peptides that bind to the Src SH3 domain. The SH3 binding peptides are useful in modulating signal transduction pathways at the cellular level (especially protein tyrosine kinase-mediated), modulating oncogenic protein activity, or providing compounds for the development of drugs with the ability to modulate broad classes, as well as specific classes, of proteins involved in signal transduction and also
                                                                            for regulating the processing, trafficking or translation of RNA. Conjugates of the peptides with detectable labels or imaging agents are useful for imaging cells, tissues and organs in which Src or Src-related
                                                                                                                                                                                                                                                                                                                                                                                               domain; SH3 domain; oncogene; consensus; lambda 14;

A fusion protein of glutathione-S-transferase, protein kinase A and Src SH3 domain was used to screen a mouse embryonal cDNA library in lambda EXIOX. Three positive clones were identified and were designated Li1, Li4 and Li35. The insert from clone Li4 contains a 221 bp region with approximately 90% identity to an anonymous cDNA (EST06380) directionally cloned from a human infant brain cDNA library. The deduced amino acid sequence contains two proline-rich, putative SH3-binding sequences. The present peptide sequence is derived from the putative SH3-binding site at residues 241-253 of Li4 and was used in an assay to determine binding to the SH3 domains of c-src and other proteins. (Updated on 25-MAR-2003 to New DNA encoding proteins that bind to Src-homology domain 3 - used to inhibit signal transduction, e.g. in cases of T cell activation. Example 1; Col 16; 39pp; English. correct PI field.)

They are peptidomimetics, and interact with protein Src homology 3 (SH3) domains, involved in protein-protein interactions in signal transduction. They cause disruption of the pathway in particular, they inhibit the protein tyrosine kinase system involved in cell growth regulation. The cells may be microbial, e.g. pathogenic bacterial or fungal cells responsible for infections, or of transformed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cells, e.g. responsible for neoplastic conditions. Specific examples of Src proteins with SH3 domains are those known by the abbreviations p85, Fyn, Lyn, Hck, Syk, GrbJ, Gap, STAT, p47-phox, p67-phox, and Brk. The present sequence represents a nonamer peptide used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    spiro[Pyrrolidine-2':3-piperidin-2-ones] and their fused ring analogues used, e.g. to modulate signal transduction protein interactions, inhibit cell growth and for use in treating infections and cancer.
                                                                                                                                                                   Src howology 3 domain; SH3 domain; peptidomimetic; mimetic; modulator; beta-turn template; spirolPyrrolidine-2':3-piperidin-2-onee]; fused ring analogue; signal transduction protein interaction; inhibit cell growth; infection; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention describes a method for treating a patient having, or is at risk of having, a cell expressing cytochrome P450 IB1 (CYPIB1), which involves administering to the patient a cytocoxic T-lymphocyte (CTL) that kills the cell, an antigen presenting cell (APC) that activates CTL, a peptide of CYPIB1 that binds to major histocompatibility activates CTL, nolecule are (1) a method for assessing the complex (MMC) molecule are: (1) a method for assessing the competide of CYPIB1. Also described are: (1) a method for assessing the level of immunity of a patient to CYPIB1 or a peptide of CYPIB1 that binds to MMC complex molecule, involving measuring the level of CTL specific for CYPIB1 or the peptide of CYPIB1 in a sample from the patient (2) a CYPIB1 peptide (I) that binds to MMC complex molecule, (3) an exvivo generated APC (III) that specifically kills a cell expressing CYPIB1 in a specific of a MHC complex-restricted fashion; and (4) and extrement of a method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient of a wing or is at risk of having a cell that expresses CYPIB1. The method is useful for the prevention, treatment and diagnosis of cancer. Graving convarian, uterine, cervical, prostate, liver, colon, pancreatic and colon, pancreatic and colon vancreatic and to brain cancer. AAMO6905 to AAM13506 represent CYPIB1 peptides which can be brain cancer used in the exemplification of the present invention
Treating a cancer patient involves administering to patient a cytotoxic T-lymphocyte, an antigen presenting cell that activates T cells, a peptide of cytochrome P450 1B1, or a polynucleotide encoding the peptide.
                                                                                                                                                                                                                                                                                    Disclosure; Page 71; 121pp; English.

The present invention describes a method for treating a patient having, or is at risk of having, a cell expressing cytochrome P450 1B1 (CYPIB1), which involves administering to the patient a cytocoxic T-lymphocyte (CTL) that kills the cell, an antiquen presenting cell (APC) that activates CTL, a peptide of CYPIB1 that binds to major histocompatibility complex (MHC) molecule, or a nucleic acid molecule encoding CYPIB1 or peptide of CYPIB1. Also described are: (1) a method for assessing the complex molecule, involving measuring the level of CYPIB1 to the peptide of CYPIB1 in a sample from the patient or specific for CYPIB1 or the peptide of CYPIB1 in a sample from the patient or vivo generated CTL (II) that binds to MHC complex molecule, (3) an exvivo generated CTL (II) that specifically kills a cell expressing CYPIB1 in a specific of a MHC complex-restricted fashion; and (4) an ex vivo generated APC (III) that presents a peptide of a CYPIB1 in the context of a MHC complex molecule. The method is useful for treating a patient construct the prevention, treatment and diagnosis of cancer. Grancer and the context of melanoma, lymphoma, carcinoma, sarcoma, multiple myeloma, leukemia, and cill gone are an expensive and context of melanoma, lymphoma, carcinoma, sarcoma, multiple myeloma, leukemia, and context of the prevention, treatment and diagnosis of cancer. ApM06905 to AAM1356 represent CYPIB1 peptides which can brain cancer. Aam06905 to AAM1356 represent CYPIB1 peptides which can brain cancer and the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       a peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating a cancer patient involves administering to patient a cytotoxic -lymphocyte, an antigen presenting cell that activates T cells, a peptid of cytochrome P450 1B1, or a polynucleotide encoding the peptide.
                                                                                                                                                                                                                Cytochrome P450 1B1; CYP1B1; cancer; immunotherapy; diagnosis; HLA; human leukcoyte antigen; cytocoxic T-lymphocyte; CTL; MHC; APC; major histocompatibility complex; antigen presenting cell; melanoma; lymphoma; carcinoma; sarcoma; multiple myeloma; leukeemia.

Treating a cancer patient involves administering to patient a cytotoxic T-lymphocyte, an antigen presenting cell that activates T cells, a peptide of cytochrome P450 1B1, or a polynucleotide encoding the peptide.

Disclosure; Page 84; 121pp; English.

The present invention describes a method for treating a patient having, or is at risk of having, a cell expressing cytochrome P450 1B1 (CYPIB1), which involves administering to the patient a cytocoxic T-lymphocyte (CTL) that kills the cell, an antigen presenting cell (APC) that activates CTL, a peptide of CYPIB1 that binds to major histocompatibility complex (MMC) molecule, or a nucleic acid molecule encoding CYPIB1 or peptide of CYPIB1 Also described are: (1) a method for assessing the cell immunity of a patient to CYPIB1 or a peptide of CYPIB1 that binds to MMC complex molecule, involving measuring the level of CYPIB1 peptide (1) that binds to MMC complex molecule, involving measuring the level of CYPIB1 corporated (TPIB1) a sample from the patient (1) (2) a CYPIB1 peptide (1) that binds to MMC complex molecule, (3) an exvivo generated APC (III) that specifically kills a cell expressing CYPIB1 in a specific of a MMC complex molecule. The method is useful for treating a patient and Complex molecule. The method is useful for treating a patient context of a MMC complex molecule. The method is useful for treating a patient context of a wing or is a trisk of having a cell that expresses CYPIB1 in the context of melanoma, lymphoma, carcinoma, sarcoma, multiple myeloma, leukemia, and cis useful for the prevention, treatment and diagnosis of cancer, e.g. melanoma, lymphoma, carcinoma, sarcoma, multiple myeloma, leukemia, and chain cancer. AAMMG505 to AAMM1356 represent CYPIB1 peptides which can bind to human leukocyte antigens (HLAs), as well as other amino acid sequence used in the exemplification of the present invention

Special activity of bradykinin potentiating peptides from Bothrops insularis snake venom.";
J. FUNCTION: This peptide both inhibits the activity of the angiotensin-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it.

II acts as an indirect hypotensive agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    "Anglotensin-converting enzyme inhibitors from the venom of Bothrops jararaca. Isolation, elucidation of structure, and synthesis."; Biochemistry 10:4033-4039(1971).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

"Primary structure and biological activity of bradykinin potentiating peptides from Bothrops insularis snake venom.";

J. Protein Chem. 9:221-227(1990).

-!- FUNCTION: This peptide both inhibits the activity of the angiotensin-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it.

It acts as an indirect hypotensive agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cintra A.C.O., Vielra C.A., Giglio J.R.,

the blowfly Calliphora vomitoria.";
Call Tissue Res. 276:367-379(1994).
-!- FUNCTION: May act as a neurotransmitter or neuromodulator and play a role in the integration of information within the brain. May be involved in the control of visceral muscles due to its ability to behave as potent inhibitors of peristalic movements. May also fulfill a neurohormonal role on muscles of the gut and heart.
-!- TISSUE SPECIFICITY: Brain, suboseophageal ganglion, retrocerebral complex. Thoracico-abdominal ganglion, peripheral neurosecretory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

-!- FTM: S-linked glycan consists of GlC-GlC-GlC trisaccharide.
-!- MISCELLANEOUS: The identity of the glycoprotein from which this peptide is derived is unknown. No physiological function has been attributed.

ALIGNMENTS

capable of modulating a fibrin fragment E activity. The perides and modulators are useful for inhibiting stimulation of cell proliferation induced by a fibrin degradation product. The antibody or binding fragment is also useful for identifying the active site of the fibrin fragment E receptor. The peptides are particularly useful in treating cancer, psocials restenosis, rheumatoid arthritis, diabetes, renal diseases or psoriasis. The antibodies are also useful for modulating the activity of the peptide New peptides capable of modulating a fibrin fragment E activity, useful for inhibiting uncontrolled cell proliferation, e.g. for treating cancer, vascular restenosis, atherogenesis or psoriasis, and for wound healing. The present invention relates to a peptide or its fragment, which is Fibrin fragment E; cell proliferation; cancer; vascular restenosis; arthritis; diabetes; renal disease; psoriasis. Peptide recognised by gene VIII library clone 45. Stirk CM; AABS9249 standard; peptide; 15 AA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a peptide or its fragment, which is capable of modulating a fibrin fragment E activity. The peptides and modulators are useful for inhibiting stimulation of cell proliferation induced by a fibrin degradation product. The antibody or binding fragment is also useful for identifying the active site of the fibrin fragment E receptor. The peptides are particularly useful in treating cancer, vascular restenosis, rheumatoid arthritis, diabetes, renal diseases or psoriasis. The antibodies are also useful for modulating the activity of
                                                                                                                                                                                                                                                                                                                                                                         New peptides capable of modulating a fibrin fragment E activity, useful for inhibiting uncontrolled cell proliferation, e.g. for treating cancer, vascular restenosis, atherogenesis or psoriasis, and for wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention relates to a peptide or its fragment, which is capable of modulating a fibrin fragment B activity. The peptides and modulators are useful for inhibiting stimulation of cell proliferation induced by a fibrin degradation product. The antibody or binding fragment is also useful for identifying the active site of the fibrin fragment receptor. The peptides are particularly useful in treating cancer, vascular restenosis, rhematoid arthritis, diabetes, renal diseases or psoriasis. The antibodies are also useful for modulating the activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New peptides capable of modulating a fibrin fragment B activity, useful for inhibiting uncontrolled cell proliferation, e.g. for treating cancer, vascular restenosis, atherogenesis or psoriasis, and for wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The dieplay library was screened for peptides which bind to the Src SH3 domain. A sequence comparison of the positive peptides revealed a highly reiterated, proline-rich, 7 amino acid consensus motif (i.e. the sequence RPLPXXP). This motif demonstrated a strong similarity to a Src SH3 binding sequence
                                                                                                                The present invention discloses a polypeptide-guanosine triphosphatase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New DNA encoding proteins that bind to Src-homology domain 3 - used to inhibit signal transduction, e.g. in cases of T cell activation.
                                                                                                                                  for
                                                                                                                                                                                                                                                                            Gaps
                                                                                                                               activator protein-10.01. The invention also discloses the method for curing several disceases, such as squamobasal cell carcinoma of skin, osteosarcoma, leukemia and teratoma by using said polypeptide. The present sequence represents the N-terminal sequence of guanosine
                                          polypeptide-guanosine triphosphatase activator protein -10.01 and symucleotide for coding this polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       7..13

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human K-ras proto-oncogene protein 10.67 polypeptide for treating malignant tumors, hemopathy, development disorder, human immunodeficiency virus infection, immunological diseases and various inflammations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention discloses a new kind of polypeptide, human K-ras proto-oncogene protein 10.67, polynucleotides encoding the polypeptide and a DNA recombination process to produce the polypeptide. The present invention also discloses applying the polypeptide in treating various diseases, such as malignant tumours, haemopathy, development disorder, human immunodeficiency virus (HTV) infection, immunological diseases and various inflammations. The present invention also discloses the antagonist resisting the polypeptide and its treatment effect. The present invention also discloses application of the polynucleotides encoding human K-ras proto-oncogene protein 10.67, The present sequence represents human K-ras proto-oncogene protein 10.67, N-terminus, used in an ELISA (enzyme-linked immunosorbent assay) experiment
                    18
identified within a protein isolated by screening a lambda-lox mouse embryo CDNA library with a Src SH3 domain probe. The present sequence is that of one of the positive peptides identified from the fuse 5B random display library. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The SH3 binding peptides are useful in modulating signal transduction pathways at the cellular level (especially protein tyrosine kinase-mediated), modulating oncogenic protein activity, or providing compounds for the development of drugs with the ability to modulate broad classes, as well as specific classes, of proteins involved in signal transduction and also for regulating the processing, trafficking or translation of RNA. Conjugates of the peptides with detectable labels or imaging agents are useful for imaging cells, tissues and organs in which Src or Src-related
                                                                                                                                                                                                                                                                                                                                                      Peptide with binding affinity for Src homology region 3 (SH3) domains of proteins - useful for e.g. modulating signal transduction pathways at the cellular level, esp. protein tyrosine kinase-mediated.
                                                                                                              Src SH3 domain-binding peptide used in signal transduction modulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Src homology 3 domain; SH3 domain; peptidomimetic; mimetic; modulator;

The present invention describes spiro[Pyrrolidine-2':3-piperidin-2-ones], their fused ring analogues, and salts of both, all as individual compounds or their libraries. They are peptidominetics, and interact with protein Src homology 3 (SH3) Gomains, involved in protein-protein interactions in signal transduction. They cause disruption of the pathway in particular, they inhibit the protein tyrosine kinase system involved in cell growth regulation. The cells may be microbial, e.g. pathogenic bacterial or fungal cells responsible for infections, or of transformed cells, e.g. responsible for neoplastic conditions. Specific examples of Src proteins with SH3 domains are those known by the abbreviations p85, Fyn, Lyn, Hck, Syk, Grb2, Gap, STAT, p47-phox, p67-phox, and Brk. The present sequence represents a nonamer peptide used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    spiro[Pyrrolidine-2':3-piperidin-2-ones] and their fused ring analogues used, e.g. to modulate signal transduction protein interactions, inhibit cell growth and for use in treating infections and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cortactin; SH3 domain; binding peptide; Src homology region 3; tyrosine kinase; immune response; lymphokine; interleukin 1; Nck; Abl; PLCgamma; p53bp2; Crk; Yes; Grb2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó
                                                                                                                                                                                                                                                 The present sequence represents a peptide which resembles a Src homology region 3 (SH3) binding peptide. SH3 binding peptides are selected from:

(a) peptides which bind the SH3 domain of Cortactin; (b) peptides which bind the Mck; (c) peptides which bind the SH3 domain of Nck; (c) peptides which bind the SH3 domain of Ab1; (d) peptides which bind the SH3 domain of PLC gamma; (f) peptides which bind the SH3 domain of peptides which bind the SH3 domain of Crk; (h) peptides which bind the SH3 domain of Crk; (h) peptides which bind the SH3 domain of Crk; (h) peptides which bind the SH3 domain of Grb; reputides which bind the amino-terminal SH3 domain of Grb. The purified binding peptides can be used in the method to identify inhibitors of their binding to their respective SH3 domains, which could be used to modulate the pharmacological activity of proteins or polypeptide containing the SH3 domain. The peptides can also be used to activate Src or Src-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Low allergenic protein variant; reduced immunogenicity; allergy prevention; epitope; personal care product; enzyme; food industry; textile industry; pharmaceutical; JE-1; natalase; amylase.
                                                                                                                                                                                                                                                                                                                                                                                                            protein tyrosine kinases, to stimulate the immune response by increasing the production of certain lymphokines, e.g. tumour necrosis factor-alpha and interleukin-1, or to deliver a conjugated molecule to certain cellular compartments containing src or Src related proteins
                                                                                                                                                                            Src homology region 3 binding peptide - used to activate Src tyrosine kinase(s) and to stimulate immune response by increasing production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present invention relates to selecting a protein variant having reduced immunogenicity as compared to a parent protein. The selected proteins can be enzymes or peptide hormones. The proteins which are selected are low allergenic proteins which can be used to prevent cases of allergy in susceptible individuals. They can be used in the food or textile industries, housekeeping, medicine, e.g. proteins used in epitope from JE-1 (Natalase/ amylase) parent protein. This sequence as derived by screening a random peptide display package library with antibodies raised against JE-1. This sequence was then subjected to genetical engineering mutations to reduce its immunogenicity. This sequence was used in a sequence alignment to determine an epitope pattern
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Allergen; protein coordinate data; vaccine; antiallergic; immunogenicity; detergent; personal care composition; cosmetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Selecting protein variants having modified immunogenicity, used to produce vaccines, detergents and personal care compositions, involves
                                                                                                                                                                                                                                                                                                                   Novel method for selecting low allergenic protein variants which are useful in industrial, food, and pharmaceutical preparations.

The invention relates to selecting a protein variant having modified immunogenicity, compared to a parent protein, comprising using the antibody binding sequence to localise epitope sequences on the three dimensional structure of the parent protein and defining an epitope area including amino acids within 5 Angstrom of the epitope amino acids. The method is useful for identifying structural epitopes on the 3-dimensional surface of commercial and environmental allergens. Compositions containing the protein variants are used as vaccines, detergents and personal care compositions, e.g. shampoo, balsam, hair conditioners, hair waring compositions, hair dyeing compositions, hair dyeing compositions, hair dyeing compositions, shir cream, sunscreen, shaving compositions, hair spray, chewing gum, skin cream, sunscreen, shaving foam, cream soap, skin milk or foundation. The present sequence is that of an antibody binding peptide sequence related to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Allergen; protein coordinate data; vaccine; antiallergic; immunogenicity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to selecting a protein variant having modified immunogenicity, compared to a parent protein, comprising using the antibody binding sequence to localise epitope sequences on the three dimensional structure of the parent protein and defining an epitope area
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           produce vaccines, detergents and personal care compositions, involves localizing epitope sequences on the three-dimensional structure of a

;
including amino acids within 5 Angstrom of the epitope amino acids. The method is useful for identifying structural epitopes on the 3-dimensional surface of commercial and environmental allergens. Compositions containing the protein variante are used as vaccines, detergents and personal care compositions, e.g. shampoo, balsam, hair conditioners, hair waving compositions, hair dyeing compositions, hair tonic, hair liquid, hair cream, hair rinse, hair spray, chewing gum, skin cream, sunscreen, shaving foam, cream soap, skin milk or foundation. The present sequence is that of an antibody binding peptide sequence related to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide with binding affinity for Src homology region 3 (SH3) domains of proteins - useful for e.g. modulating signal transduction pathways at the cellular level, esp. protein tyrosine kinase-mediated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            modulating oncogenic protein activity, or providing compounds for the development of drugs with the ability to modulate broad classes, as well as specific classes, of proteins involved in signal transduction and also for regulating the processing, trafficking or translation of RNA. Conjugates of the peptides with detectable labels or imaging agents are useful for imaging cells, tissues and organs in which Src or Src-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          binding peptides are useful in modulating signal transduction pathways at
the cellular level (especially protein tyrosine kinase-mediated),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Src SH3 domain-binding peptide used in signal transduction modulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Src; SH3; Src homology region 3; binding affinity; oncogenic protein; protein tyrosine kinase; signal transduction; RNA processing;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW11098-W11124 are peptides that bind to the Src SH3 domain. The SH3
                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAWI1098-W11124 are peptides that bind to the Src SH3 domain. The SH3 binding peptides are useful in medulating signal transduction pathways at the cellular level (especially protein tyrosine kinase-mediated), modulating oncogenic protein activity, or providing compounds for the everlopment of drugs with the ability to modulate broad classes, as well as specific classes, of proteins involved in signal transduction and also for regulating the processing, trafficking or translation of RNA. Conjugates of the peptides with detectable labels or imaging agents are useful for imaging cells, tissues and organs in which Src or Src-related proteins are expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of

SH3 (Src homology region 3) binding peptides are selected from: (a) peptides which bind the SH3 domain of Cortactin, (b) peptides which bind the sH3 domain of Cortactin, (b) peptides which bind the SH3 domain of Nck, (c) peptides which bind the SH3 domain of BLC; (d) peptides which bind the SH3 domain of Src; (e) peptides which bind the SH3 domain of Src; (e) peptides which bind p53bp2; (g) peptides which bind the SH3 domain of Yes; and (i) peptides which bind the SH3 domain of Carb2. The amino-remainal SH3 domain of Gab2. The purified binding peptides can be used in the method to identify inhibitors of their binding to their respective SH3 domains, which could be used to modulate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              protein tyrosine kinases, to stimulate the immune response by increasing the production of certain lymphokines, e.g. tumour necrosis factor-alpha and interleukin-1, or to deliver a conjugated molecule to certain cellular compartments containing Src or Src related proteins
                                                Cortactin; SH3 domain; binding peptide; Src homology region 3; tyrosine kinase; immune response; lymphokine; interleukin 1; NCk; Abl; PLCgamma; p53bp2; Crk; Yes; Grb2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Src homology region 3 binding peptide - used to activate Src tyrosine kinase(s) and to stimulate immune response by increasing production of certain lymphokine(s), e.g. interleukin-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         pharmacological activity of proteins or polypeptide containing the SH3 domain. The peptides can also be used to activate Src or Src-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

A;Status: preliminary
Molecule type: protein
A;Residues: 1-13 < BR2>
C;Comment: This protein is one of monoclonal IgM reactive with myelin-associated glycopz
C;Keywords: glycoprotein; heterotetramer; immunoglobulin

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present invention relates to a peptide or its fragment, which is capable of modulating a fibrin fragment E activity. The peptides and modulators are useful for inhibiting stimulation of cell proliferation induced by a fibrin degradation product. The antibody or binding fragment is also useful for identifying the active site of the fibrin fragment receptor. The peptides are particularly useful in treating cancer, vascular restenosis, rhewmatoid archirits, diabetes, renal diseases or psoriasis. The antibodies are also useful for modulating the activity of

```
New peptides capable of modulating a fibrin fragment E activity, useful for inhibiting uncontrolled cell proliferation, e.g. for treating cancer, vascular restenosis, atherogenesis or psoriasis, and for wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a peptide or its fragment, which is capable of modulating a fibrin fragment B activity. The peptides and modulators are useful for inhibiting stimulation of cell proliferation induced by a fibrin degradation product. The antibody or binding fragmen is also useful for identifying the active site of the fibrin fragment B receptor. The peptides are particularly useful in treating cancer, vascular restenosis, rheumatoid arthritis, diabetes, renal diseases or psoriasis. The antibodies are also useful for modulating the activity of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a peptide or its fragment, which is capable of modulating a fibrin fragment E activity. The peptides and modulators are useful for inhibiting stimulation of cell proliferation induced by a fibrin degradation product. The antibody or binding fragment is also useful for identifying the active site of the fibrin fragment sceeptor. The peptides are particularly useful in treating cancer, vascular restenosis, rheumatoid arthritis, diabetes, renal diseases or psoriasis. The antibodies are also useful for modulating the activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   for inhibiting uncontrolled cell proliferation, e.g. for treating cancer, vascular restenosis, atherogenesis or psoriasis, and for wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New peptides capable of modulating a fibrin fragment E activity, useful

A fusion phage library for expressing random 15mer peptides was prepared using the filamentous bacteriophage fuse 5B. The display library was screened for peptides which bind to the Src SH3 domain. A sequence comparison of the positive peptides revealed a highly reiterated, proline rich, 7 amino acid consensus motif (i.e. the sequence RPLPXXP). This motif demonstrated a strong similarity to a Src SH3 binding sequence
                                                                                                                  The present invention discloses a polypeptide-guanosine triphosphatase activator protein-10.01. The invention also discloses the method for curing several diseases, such as squamobasal cell carcinoma of skin, osteosarcoma, leukemia and teratoma by using said polypeptide. The present sequence represents the N-terminal sequence of guanosine triphosphate activator protein 10.01
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New DNA encoding proteins that bind to Src-homology domain 3 - used to
                                         A polypeptide-guanosine triphosphatase activator protein -10.01 and polynucleotide for coding this polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New human K-ras proto-oncogene protein 10.67 polypeptide for treating malignant tumors, hemopathy, development disorder, human immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention discloses a new kind of polypeptide, human K-rass and a DNA recombination process to produce the polypeptide. The present invention also discloses applying the polypeptide in treating various diseases, such as malignant tumours, haemopathy, development disorder, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The present invention also discloses the antagonist resisting the polypeptide and its treatment effect. The present invention also discloses application of the polynucleotides present invention also discloses application of the polynucleotides recoding human K-ras proto-oncogene protein 10.67, The present sequence represents human K-ras proto-oncogene protein 10.67, N-terminus, used in an ELISA (enzyme-linked immunosorbent assay) experiment
identified within a protein isolated by screening a lambda-lox mouse embryo CDNA library with a Src SHH domain probe. The present sequence is that of one of the positive peptides identified from the fuse 5B random display library. (Updated on 25-MAR-2003 to correct PI field.)

AAWI1098-WI1124 are peptides that bind to the Src SH3 domain. The SH3 binding peptides are useful in modulating signal transduction pathways at the cellular level (especially protein tyrosine kinase-mediated), modulating oncogenic protein activity, or providing compounds for the development of drugs with the ability to modulate broad classes, as well as specific classes, of proteins involved in signal transduction and also for regulating the processing, trafficking or translation of RNA. Conjugates of the peptides with detectable labels or imaging agents are useful for imaging cells, tissues and organs in which Src or Src-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide with binding affinity for Src homology region 3 (SH3) domains of proteins - useful for e.g. modulating signal transduction pathways at the cellular level, esp. protein tyrosine kinase-mediated.
                                                                                                                      Src SH3 domain-binding peptide used in signal transduction modulation.

The present invention describes spiro[Pyrrolidine-2':3-piperidin-2-ones], their fused ring analogues, and salts of both, all as individual compounds or their libraries. They are peptidominatics, and interact with protein Src homology 3 (SH3) domains, involved in protein-protein interactions in signal transduction. They cause disruption of the pathway in particular, they inhibit the protein tyrosine kinase system involved in cell growth regulation. The cells may be microbial, e.g. pathogenic bacterial or fungal cells responsible for infections, or of transformed cells, e.g. responsible for neoplastic conditions. Specific examples of Src proteins with SH3 domains are those known by the abbreviations p85, Fyn, Lyn, Hck, Syk, Grb2, Gap, STAT, p47-phox, p67-phox, and Brk. The present sequence represents a nonamer peptide used in an example from the

The present sequence represents a peptide which resembles a Src homology region 3 (SH3) binding peptide. SH3 binding peptides are selected from:

(a) peptides which bind the SH3 domain of Cortactin; (b) peptides which bind the SH3 domain of Cortactin; (b) peptides which bind the SH3 domain of Src; (e) peptides which bind the SH3 domain of Src; (e) peptides which bind the SH3 domain of Crk;

(b) peptides which bind the SH3 domain of Yes; and (i) peptides which bind the amino-terminal SH3 domain of Crk;

(h) peptides which bind the SH3 domain of Yes; and (i) peptides which bind the amino-terminal SH3 domain of Grb. The purified binding peptides to a used in the method to identify inhibitors of their binding to their respective SH3 domains, which could be used to modulate the pharmacological activity of proteins or polypeptide containing the SH3 domain. The peptides can also be used to activate Src or Src-related protein tyrosine kinases, to stimulate the immune response by increasing the production of certain lymphokines, e.g. tumour necrosis factor-alpha and interleukin-1, or to deliver a conjugated molecule to certain
                                                                                                                                                                                                                                                           Src homology region 3 binding peptide - used to activate Src tyrosine kinase(s) and to stimulate immune response by increasing production of certain lymphokine(s), e.g. interleukin-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Src SH3 domain-binding peptide used in signal transduction modulation.

                                                                                                                                                                                                     AAWI1098-WI1124 are peptides that bind to the Src SH3 domain. The SH3 binding peptides are useful in modulating signal transduction pathways at the cellular level (especially protein tyrosine kinase-mediated), modulating oncogenic protein activity, or providing compounds for the development of drugs with the ability to modulate broad classes, as well as specific classes, of proteins involved in signal transduction and also for regulating the processing, trafficking or translation of RNA. Conjugates of the peptides with detectable labels or imaging agents are useful for imaging cells, tissues and organs in which Src or Src-related
                                                                                                                 Peptide with binding affinity for Src homology region 3 (SH3) domains of proteins - useful for e.g. modulating signal transduction pathways at the cellular level, esp. protein tyrosine kinase-mediated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide with binding affinity for Src homology region 3 (SH3) domains of proteins - useful for e.g. modulating signal transduction pathways at the cellular level, esp. protein tyrosine kinase-mediated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Src SH3 domain-binding peptide used in signal transduction modulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

AAWI1098-WI1124 are peptides that bind to the Src SH3 domain. The SH3 binding peptides are useful in modulating signal transduction pathways at the cellular level (especially protein tyrosine kinase-mediated), modulating oncogenic protein activity, or providing compounds for the development of drugs with the ability to modulate broad classes, as well as specific classes, of proteins involved in signal transduction and also for regulating the processing, trafficking or translation of RNA. Conjugates of the peptides with detectable labels or imaging agents are useful for imaging cells, tissues and organs in which Src or Src-related

Src homology region 3 binding peptide - used to activate Src tyrosine kinase(s) and to stimulate immune response by increasing production of certain lymphokine(s), e.g. interleukin-1. Src homology

Disclosure; Fig 7; 131pp; English.

(Str. homology region 3) binding peptides are selected from: (a) peptides which bind the SH3 domain of Cortactin, (b) peptides which bind the Mal domain of Cortactin, (b) peptides which bind the Mal domain of McK; (c) peptides which bind the SH3 domain of Ab1, (d) peptides which bind the SH3 domain of Str. (e) peptides which bind the SH3 domain of Crk; (e) peptides which bind the Mal domain of Crk; (i) peptides which bind the MH3 domain of Crk; (ii) peptides which bind the MH3 domain of Crk; (ii) peptides which bind the SH3 domain of Grb2. The purified binding peptides can the amino-terminal SH3 domain of Grb2. The purified binding peptides can be used in the method to identify inhibitors of their binding to their pharmacological activity of proteins or polypeptide containing the SH3 domain. The peptides can also be used to activate Src or Src-related the present sequence represents a Src SH3 synthetic binding peptide. SH3

polypeptides in samples

Sequence 14 AA;

```
AA173060 to AA179867 represent isolated human polymorphic polymuclectide sequences [1], which contain single nuclectide polymorphisms (SNPs).

AAW53114 to AAM53329 represent peptides related to human polymorphic polymorphic polymorphic polymorphic polymorphic sequences. The sequences can be used in protein the prevention. [1] and the polypeptides encoded by therapy, and in vaccine production. [1] and the polypeptides encoded by expensive the properties of diseases associated with inappropriate expression of polymorphic polypeptides. For example, [1] may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptides. Additionally, [1] and its complementary and quantitate the presence of similar nucleic assays to detect therefore which patients may be in need of restorative therapy. The preference may be used as antigens in the production of polypeptides encoded by [1] may be used as antigens in the production of antithedian encoded by [1] may be used as antigens in the production of antithedian encoded by [1] may be used as antigens in the production of

The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
protein tyrosine kinases, to stimulate the immune response by increasing the production of certain lymphokines, e.g. tumour necrosis factor-alpha and interleukin-1, or to deliver a conjugated molecule to certain cellular compartments containing Src or Src related proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human nonconservative amino acid changing SNP related peptide SEQ:6990.

The present invention describes a method for treating a patient having, or is at risk of having, a cell expressing cytochrome P450 1B1 (CYPIB1), which involves adminiatering to the patient a cytocoxic T-lymphocyte (CTL) that kills the cell, an antigen presenting cell (APC) that cell, a peptide of CYPIB1 that binds to major histocompatibility activates CTL, a peptide of CYPIB1 that binds to major histocompatibility complex (MHC) molecule or CYPIB1 or peptide of CYPIB1. Also described are: (1) a method for assessing the complex molecule, involving measuring the level of CYPIB1 or the peptide of CYPIB1 or a peptide of CYPIB1 that binds to MHC complex molecule, involving measuring the level of CTL cspecific for CYPIB1 or the peptide of CYPIB1 in a sample from the patient cspecific of CYPIB1 or the specifically kills a cell expressing CYPIB1 or a specific of a MHC complex molecule. The method is useful for treating a patient or a specific of a MHC complex-restricted fashion; and (4) and extinct complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient of a useful for the prevention, treatment and diagnosis of cancer. Graving or is at risk of having a cell that expresses CYPIB1. The method is useful for the prevention, treatment and diagnosis of cancer. Graving or arian, uterime, cervical, prostate, liver, colon, pancreatic and clung, ovarian, uterime, cervical, prostate, liver, colon, pancreatic and colon, pancreatic and chain cancer. AAM05005 to AAM13566 represent CYPIB1 peptides which can be an order of the present invention and context of sequence used in the exemplification of the present invention

The present invention describes a method for treating a patient having, or is at risk of having, a cell expressing cytochrome P450 IBI (CYPIBI), which involves administering to the patient a cytocoxic T-lymphocyte (CTL) that kills the cell, an antigen presenting cell (APC) that complex (MTC) molecule, or a nucleic acid molecule encoding CYPIBI or complex (MMC) molecule, or a nucleic acid molecule encoding CYPIBI or peptide of CYPIBI. Also described are: (1) a method for assessing the level of immunity of a patient to CYPIBI or a peptide of CYPIBI that complex molecule, involving measuring the level of CYPIBI or the peptide of CYPIBI in a sample from the patient of peptide of CYPIBI or the peptide of CYPIBI in a sample from the patient of complex molecule (1) that binds to MHC complex molecule; (3) an exvivation a specific of a MHC complex restricted fashion; and (4) and exvivation as specific of a MHC complex molecule. The method is useful for treating a patient can any or is at risk of having a cell that expresses CYPIBI. The method is useful for the prevention, treatment and diagnosis of cancer, e.g. melanoma, lymphoma, carcinoma, sarcoma, multiple myeloma, leukemia, and cludy ovarian, uterine, cervical, prostate, liver, colon, panorcatic and brain cancer. AAMO6505 to AAMI3566 represent CYPIBI peptides which can brain cancer and in the exemplification of the present invention

Primary Structure and biological activity of bradykinin potentiating peptides from Bothrops insularis snake venom.";
J. Protein Chem. 9:221-227(1990).
-!- FUNCTION: This peptide both inhibits the activity of the angiotensin-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it.

It acts as an indirect hypotensive agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Electrophoresis 20:1098-1108(1999).

-!- FUNCTION: May be involved in the regulation of photosystem II.

-!- SUBCELLULAR LOCATION: Chloroplast thylakoid membrane; associated with the photosystem II complex (By similarity).

-!- MISCELLANBOUS: On the 2D-gel the determined pI of this protein (spot NI79) is: 5.9, its MW is: 22 kDa.

-!- SIMILARITY: Belongs to the psbP family.

Photosynthesis; Photosystem II; Chloroplast; Thylakoid; Membrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-APR-1993 (Rel. 25, Created)

"Primary structure and biological activity of bradykinin potentiating peptides from Bothrops insularis snake venom.";
J. Protein Chem. 9:221-227 (1990).

-I. FUNCTION: This peptide both inhibits the activity of the angiotensin-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chernysh S., Codiancich S., Briand J.-P., Hetru C., Bulet P., "The inducible antibacterial peptides of the hemipteran insect Palomena pragina: identification of a unique family of proline-rich peptides and of a novel insect defensin.";

May be involved in the control of visceral muscles due to its ability to behave as potent inhibitors of peristalic movements. May also behave as potent inhibitors of peristalic movements. May also fulfill a neurohormonal role on muscles of the gut and heart.
